LI

regulated by a 24" sliding headgate. The emergency spillway is an uncontrolled saddle type excavated in rock with a 16 foot base width. The embankment is free of undesirable vegetation except for some scattered 1/2-2" diameter heavenwood

trees. Most of these are at the downstream right toe and abutment tie-in. No signs of sliding, cracking, or differentail settlement were observed on the dam or in the area immediately downstream. Erosion was insignificant. On the basis of a federal hazard potential classification of "high" and an "intermediate" size classification, the dam should pass the full probable Maximum Flood (PMF) of 28.5" of rain falling in 6 hours. Analysis reveals that the dam will overtop by about 3.4' for 1.8 hours during this storm. The 1/2 PMF will also overtop the structure. The dam received a condition classification of "significantly deficient" because of its spillway limitations. It is recommended that a qualified engineer be engaged to develop project modifications that will allow the dam to pass the PMF and that the owner perform various maintenance operations.

DEPARTMENT OF THE ARMY BHVILLE DISTRICT, CORPS OF ENGINEERS P. O. BOX 1070

NASHVILLE, TENNESSEE 37202

9 JUN 1981

Honorable Lamar Alexander Governor of Tennessee Nashville, TN 37219

Dear Governor Alexander:

Furnished herewith is the Phase I Investigation Report on Jennings Creek Watershed Dam No. 15 near North Springs, Tennessee. The report was prepared under the authority and provisions of PL 92-367, the National Dam Inspection Act, dated 8 August 1972.

The report presents details of the field inspection, background information, technical analyses, findings, and recommendations for improving the condition of the dam.

Based upon the inspection and subsequent evaluation, Jennings Creek Watershed Dam No. 15 is classified as significantly deficient due to insufficient storage and spillway capacity to pass the probable maximum flood and excessive growth of trees and brush on the embankment.

The recommendation concerning project modifications to allow safe passage of the design flood and others contained in this report should be undertaken in the near future.

Public release of the report and initiation of public statements fall within your prerogative. However, under provisions of the Freedom of Information Act, the Corps of Engineers is required to respond fully to inquiries on information contained in the report and to make it accessible for review on request.

incerely.

Your assistance in keeping me informed of any further developments will be appreciated.

PREFACE

This report is prepared under guidance contained in the Department of the Army, Office of the Chief of Engineers, Recommended Guidelines for Safety Inspection of Dams, for a Phase I investigation. The purpose of the Phase I investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I investigation; however, the investigation is intended to identify any need for such studies.

In the review of this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. Additional data or data furnished containing incorrect information could alter the findings of this report. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structures and may obscure certain conditions which might be detectable if inspected under the normal operating environment of the structure.

The analyses and recommendations included in this report are related to the hazard classification of the structure at the time of the report. Changes in conditions downstream of the dam may change the hazard classification of the structure. A change in hazard classification may in turn change the design flood on which the hydraulic and hydrologic analyses are based and may have a significant impact on the assessment of the safety of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions and is evolutionary in nature. It would be incorrect to assume that the present conditions of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspections can there be any chance that unsafe conditions will be detected.

Jennings Creek Dam No. 15

Jackson County

April 2, 1981

PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM TENNESSEE

| Name of Dam Jennings Creek Watershed Dam No. 15 |
|---|
| County Jackson |
| Stream Trib. of Jennings Creek at Hudson Hollow |
| Date of Inspection January 8, 1981 |

ABSTRACT

The dam is a linear earthen structure 310 feet long and 44.7 feet high with a crest width of 14 feet. The upstream and downstream slopes are 2.6H:lV and 2.5H:lV respectively.

The principal spillway consists of a 2' x 6' (ID) concrete riser with a 15" steel cylinder concrete pipe. The reservoir is drained from the base of the riser through a 16" diameter formed opening regulated by a 24" sliding headgate. The emergency spillway is an uncontrolled saddle type excavated in rock with a 16 foot base width.

The embankment is free of undesirable vegetation except for some scattered ½-2" diameter heavenwood trees. Most of these are at the downstream right toe and abutment tie-in.

No signs of sliding, cracking, or differential settlement were observed on the dam or in the area immediately downstream. Erosion was insignificant.

On the basis of a federal hazard potential classification of high and an intermediate size classification, the dam should pass the full Probable Maximum Flood (PMF) of 28.5% of rain falling in 6 hours. Analysis reveals that the dam will overtop by about 3.4′ for 1.8 hours during this storm. The PMF will also overtop the structure.

The dam received a condition classification of significantly deficient because of its spillway limitations.

It is recommended that a qualified engineer be engaged to develop project modifications hat will allow the dam to pass the PMF and that over perform various maintenace operations.

•

PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM JENNINGS CREEK WATERSHED DAM # 15 JACKSON COUNTY, TENNESSEE

SECTION 1 - GENERAL

- Authority The Phase I inspection of this dam was conducted under the authority of the Tennessee Code Annotated, Section 70-2501 to 70-2530, "The Safe Dams Act of 1973", in cooperation with the U. S. Army Corps of Engineers under the authority of Public Law 92-367, "The National Dam Inspection Act".
- Purpose and Scope The purpose of a Phase I investigation is to develop an engineering assessment of the general condition of a dam with respect to safety and stability. This is accomplished by conducting a visual inspection, reviewing any available design and construction data, and performing appropriate hydraulic, hydrologic, and other analyses. A comprehensive description of the Phase I investigation program is given in Recommended Guidelines for Safety Inspection of Dams, by the Department of the Army, Chief of Engineers, Washington, D. C. 20314.
- Past Inspections Personnel from the Tennessee
 Department of Conservation, Division of Water
 Resources surveyed the dam and conducted a cursory
 inspection of the site on November 5, 1980. The
 dam is inspected at least annually by SCS to provide
 maintenance recommendations for the Watershed
 District Board.
- Details of Inspections The Phase I visual inspection of Jennings Creek Watershed Dam # 15 was conducted on January 8, 1981. The weather was partly cloudy with a temperature of 25-30°F. Approximately 1" of melting snow was on the ground. Most of the embankment was clear, however, because of its direct exposure to the sun. The southern exposure of the downstream slope kept it even clearer, so the inspection was not significantly hindered because of snow. The reservoir was empty at the time of the inspection at the request of the landowner.

1.5 <u>Inspection Team Members</u> - Field inspection was performed by the following State personnel:

Edmond O'Neill Robert Ramsey William Culbert, Jr.

The team was accompanied by Al Dunn (Corps of Engineers), Perry Fuqua (SCS), and Jonah Sadler (property owner).

SECTION 2 - PROJECT DESCRIPTION

- Location Jennings Creek Watershed Dam No. 15 is located in Jackson County, Tennessee, 600 feet north of State Highway 56 and 3,000 feet east of the Macon-Jackson County line. The dam is on the Hudson Hollow tributary of Jennings Creek. It is shown on the U. S. Geologic survey 7.5 minute Willett Quadrangle map at 36°28'19" N latitude and 85°45'30" W longitude. Location maps are provided in Appendix B of this report.
- History of Project The dam was completed in 1961 under the authority of the watershed protection and flood prevention act (Public Law 566). Its primary function is flood control. It is one of a series of dams sponsored by the Jennings Creek Watershed District, the Jackson County Soil Conservation District, the Macon County Soil Conservation District, and the Clay County Soil Conservation District with the assistance by the Soil Conservation Service. Construction was by Ascon, Inc. It is owned by Jonah Sadler.

The lake was drained in the summer of 1980 to allow installation of a 24" drawdown headgate on the principal spillway riser. The reservoir remains empty at the request of the property owner.

- Size and Hazard Classification The dam is in the intermediate size classification, with a measured height of 44.7'. Reservoir storage is calculated as 31 acre-feet at normal pool and 161 acre-feet at the emergency spillway crest. The dam is classified as high hazard because of the presence of two occupied houses 400 and 800 feet downstream (see photo no. 2).
- 2.4 Description of Dam and Appurtenances
- 2.4.1 Embankment The embankment is an earthfill structure reportedly constructed using residual clay derived from the in-situ weathering of the underlying bedrock.

The dam is underlain by Mississippian Age and Ordovician Formations of high chert limestone. The bedding planes are mostly horizontal with appreciable cavernous solution zones.

The dam is measured 44.7 feet high and 310 feet long with a crest width of 14 feet. The crest elevation varies from 709.0 feet to 710.4 feet. The downstream and exposed upstream faces of the dam are uniform with slopes of 2.5H:1V and 2.6H:1V respectively. An 8 foot wave berm at the normal pool water surface defines the upper limit of a 2.7H:1V slope extending down to the lake floor.

The design plans specify a cutoff trench, excavated to bedrock (elevation 656) along the centerline of the dam, with 1:1 side slopes and a 10' base width.

- 2.4.2 Service Spillway The principal spillway maintains
 Normal Pool at elevation 684.5. It consists of a
 2' x 6' (inside diameter) reinforced concrete riser
 19' tall, feeding into a 15" AWWA C-301 steel cylinder
 concrete pipe 242' long (see photo nos. 8 and 12).
- Emergency Spillway The emergency spillway is excavated in rock, left of the embankment. The right side slope is 2.4H:lV. The base width is 16' with a crest elevation of 701.0'. The left side slope is effectively 1.6H:lV for 4.7' above the crest, then it extends vertically upward for 11' (see photo nos. 5 and 6). The approach and exit channels are on 6% and 3% slopes respectively.
- 2.4.4 <u>Drawdown Facilities</u> The drawdown facilities consist of a 16" pipe (invert elevation 668.0) controlled by a 24" slide gate. The gate is manually operated from the top of the riser (see photo nos. 7 and 8).
- Downstream Channel The channel is shallow and poorly defined for several hundred feet downstream of the dam, until it crosses under the highway bridge. In this area, the channel has a base width of approximately 8', a depth of 6', and 2H:1V side slopes. Further downstream, the channel flattens out as it exits from the hollow into the bottomland. It lies on a 2% slope and apparently seldom carries more than a nominal flow as evidenced by its vegetative cover and minor erosion (see photo no. 2).

4

- 1 · 1

Reservoir and Drainage Area - The storage capacity of the reservoir at normal pool elevation 684.5 is 31 acre-feet. The pool area at this elevation is 5.7 acres. The dam crest elevation of 709.0 provides 255 acre-feet of storage with a surface area of 14 acres.

At a 40% average ground slope the basin is unusually steep. The main channel extends most of the length of the longest water course and has no significant tributaries.

The size of the drainage area is 490 acres (0.766 mi²). Major soil types in the watershed include Bodine, Mountview, Delrose, Dickson, and Mimosa. The drainage area is mountainous and predomantly wooded.

SECTION 3 - FINDINGS

3.1 Visual Findings

- 3.1.1 Embankment The grass cover of the dam is full and uniform over practically the entire surface. The embankment hosts no deleterious vegetative growth other than a few small diameter trees. The side slopes and crest of the dam are uniform with good definition. No signs of cracking, sliding, or differential settlement were observed.
- 3.1.2 Service Spillway The riser appears to be in excellent condition with no noteworthy cracking or weathering. The drawdown gate and operating mechanisms have been recently installed and appear to be operable (see photo nos. 7 and 8). The drawdown inlet and lake bottom have accumulated little sediment so presumably the spillway culvert is clear also. This cannot be ascertained since the outfall is practically submerged (see photo no. 12). The visible portion of the pipe appears to be in good contion.
- Emergency Spillway The emergency spillway is uniform over its entire length. The only noteworthy obstructions are a small copse on the embankment side of the channel near the critical section and some loose rock along the left side of the base. The later obstruction, however, was considered in the hydraulic calculations. No appreciable erosion was observed along the spillway itself, but a gully, approximately 4' deep and 6' wide has eroded off of the right side of the spillway's exit channel tapering away as it reaches the natural stream just downstream of the plunge pool (see photo no. 10).

A small mud slide occurred on the left side slope of the emergency spillway approximately 50' upstream of the critical section. Most of the earth was deposited on the spillway entrance channel near the lip of the natural reservoir basin. The slide was apparently minor because the property owner, Jonah Sadler, was rather unconcerned about any obstruction that may have

occurred. It was removed during replacement of the spillway head gates in the summer of 1980.

- 3.1.4 Downstream Channel The downstream channel is relatively clear and flat for a few hundred feet downstream of the dam. It is well grassed over most of its surface, showing signs of only minor erosion. This is understandable since the principal spillway can deliver no more than 30 cfs at maximum head. A few hundred feet further downstream the channel flattens out, increases in size, and loses some of its vegetative cover.
- Reservoir and Drainage Area The floor of the reservoir is clear of any large trees and debris. Sediment is minimal because the drainage area is 90% wooded.

Since the installation of the new drawdown headgates, the reservoir remains drained at the owners request. There has been some illicity dynamite fishing in the lake and the owner is concerned about vandalism, as well as the danger of a flood.

Review of Data - Information available for review includes the SCS design drawings and the Watershed Work Plan prepared by Jennings Creek Watershed District, the SCS, and Soil Conservation Districts of Jackson, Clay, and Macon Counties.

The bedrock within the Jennings Creek Watershed consists of formations of Ordovician and Mississippian age. The rock strata has nearly horizontal bedding. The composition of the rock ranges from thin to massive bedded limestone, cherty limestone, shaly limestone, and shale. There are extensive outcrops of bedrock on the steeper slopes with intermittent areas of shallow residual soil overburden. The presence of cherty limestone formations has led to high chert content in the colluvial and alluvial soils and in many of the residual soils. Many solution zones are present in the limestone bedrock. These are in the form of caverns, solution planes, and small sink holes.

The design plans specify a cutoff trench, excavated to bedrock (approximate elevation 656) along the dam centerline, with 1:1 side slopes and a 10' base width.

According to the owner, no grouting was performed on the project.

- 3.3 Static and Seismic Statility The actual margin of safety for static stability cannot be determined because the engineering data required for an analytical stability analysis are not available. However, an assessment of the embankment stability based on visual evidence and engineering judgment would indicate a stable structure due to moderate embankment slopes and the lack of leaks or seepage. The project is located in Seismic Zone 1, and according to OCE guidelines, should not be expected to be threatened by seismic effects provided static conditions are satisfied.
- Hydraulic and Hydrologic Analysis According to OCE guidelines, the design flood for an intermediate size dam in a high hazard area is the Probable Maximum Flood (PMF). Hydraulic analysis indicates that outflow resulting from the PMF (AMC II) will overtop the dam by a maximum depth of 3.4' for a duration of 1.8 hours. Additional analysis indicates that outflow from the PMF will overtop the dam by a maximum depth of .93' for 0.5 hours.

Assuming that the rock debris was cleared away from the spillway side walls and that the crest of the spillway was graded level to elevation 701.0 over its entire length, the dam would overtop by 2.7' for 1.6 hours during the PMF. The ½PMF would overtop the dam by 0.7' for 0.4 hours. (See Appendix F)

- 3.5 Conclusions and Recommendations
- 3.5.1 Conclusions On the basis of visual evidence and engineering judgment, the dam is considered to be structurally stable. The embankment slopes are moderate and are considered adequate. No seepage problems appear to exist. The dam has the appearance that it is well constructed.

Hydraulic analysis indicates that the spillway will not pass the PMF as required by OCE guidelines for dams of intermediate size and high hazard potential.

The project is situated in Seismic Zone 1, indicating that risk of damage from seismic activity is only minor.

The dam is considered to have a condition classification of "significantly deficient" solely because the spillway will not pass the appropriate design flood. It does not pose a threat of imminent failure.

3.5.2 Recommendations

- a. Remove all trees and all other woody vegetation from the embankment.
- b. The services of a qualified engineer should be obtained for development of project modifications that will allow safe passage of the PMF.
- c. An emergency action plan should be developed, including a warning system to alert downstream residents, in the event a serious condition develops with the dam.

SECTION 4 REVIEW BOARD FINDINGS

The Interagency Review Board for the National Program of Inspection of Non-Federal Dams met in Nashville on 10 April 1981 to examine the technical data contained in the Phase I investigation report for Jennings Creek Watershed Dam No. 15. The Review Board considered the information and recommended that (1) the ownership of the dam be clarified and the owner be made aware of his responsibilities in relation to the operation and maintenance of the structure, (2) an emergency action plan be developed, including a warning system to alert downstream residents in the event that a serious condition develops with the project, (3) an inspection during normal pool conditions should be undertaken to observe any problems not apparent with a dry reservoir, and (4) the condition classification should be changed from "unsafe-nonemergency" to "significantly deficient." They agreed with other report conclusions and recommendations. A copy of the letter report presented by the Review Board is included in Appendix G.

The second of the second

APPENDIX A
DATA SUMMARY

APPENDIX A DATA SUMMARY

- A.1 Dam
- A.1.1 Type The dam is a linear earthen structure with an open channel emergency spillway excavated in rock at the left abutment. The principal spillway is a reinforced concrete riser with a steel cylinder pipe.
- A.1.2 <u>Dimensions and Elevations</u> Elevations are expressed in feet above mean sea level and are referenced to the emergency spillway crest, elevation 701.0, as given on the SCS design drawings.
 - a. Crest length 310'
 - b. Crest width 14'
 - c. Height 44.7' (low point in crest to downstream invert of principal spillway pipe)
 - d. Crest elevation 709.0
 - e. Emergency spillway crest elevation 701.0
 - f. Principal spillway crest elevation 684.5 (normal pool)
 - g. Embankment slope, upstream 2.6H:1V
 - h. Embankment slope, downstream 2.5H:1V
- A.1.3 Embankment Zoning None
- A.1.4 Cut-off and Grout Curtains A cut-off trench was excavated to bedrock (elevation 656) along the dam centerline. The design plans specify a 10' base width and 1:1 side slopes. A 4' wide by 8' tall embankment drain 230' in length is specified for the downstream slope. Its design location is 62' upstream of the principal spillway outlet. It is designed to consist of Olean sand and gravel surrounding an 8" diameter perforated corregated metal pipe. No grouting was done on the foundation.

A.1.5 Instrumentation - None

A.1.6 Operation and Maintenance - Section 70-1801 through 70-1849 of the Tennessee Code Annotated (Watershed District Act of 1955) provides for the establishment of the Watershed Districts and the Watershed District Boards. Easement rights for the construction of the Jennings Creek Dams were obtained by the Board from the local property owners. The extent of ownership retained by the individuals is being negotiated, with the stipulation (Section 70-1847) that the Board has full operation and maintenance authority.

In the case of Jennings Creek, the entire Board has been liquidated through death or retirement. A written petition signed by 5% of the land owners in the watershed is required for it to be reestablished (by TCA Section 70-1822). A petition has been drafted and signed and is awaiting action from the court.

According to Perry Fuqua, SCS District Conservationist, Jackson County, the Watershed District is to make periodic inspections of the dams as needed and at least annually to determine any remedial measures needed.

A record of the inspections and maintenance operations is to be kept on file and will be available for use by representatives of the SCS. Specific maintenance agreements are to be executed prior to the construction of structural works of improvements.

A.2 Reservoir and Drainage Area

A.2.1 Reservoir

- a. Normal Pool
 - 1. Elevation 684.5
 - 2. Surface area 5.7 acres
 - 3. Storage 31 acre-feet
 - 4. Length of reservoir 1100'

100 mg

- b. At Emergency Spillway Crest
 - 1. Elevation 701.0
 - 2. Surface area 10 acres
 - 3. Storage 161 acre-feet
- c. At Maximum Pool
 - 1. Elevation 709.0
 - 2. Surface area 14 acres
 - 3. Storage 255 acre-feet

A.2.2 Drainage Area

- a. Size 490 acres
- Soils Bodine, Mountview, Delrose, Dickson, Mimosa
- c. Average slope 40%
- d. Land use Woods, pasture, few roads, and isolated structures
- e. Runoff from PMP (28.5" in 6 hours)
 - 1. AMC II 24.5"
 - 2. AMC III 26.8"
- f. Runoff from 100 year storm (4.8" in 6 hours)
 - 1. AMC II 2.2"
 - 2. AMC III 3.4"

A.3 Outlet Structures

A.3.1 Service Spillway and Drawdown

- a. Type Single stage concrete riser and AWWA C-301 steel cylinder concrete pipe
- b. Size Riser 2' x 6' (inside diameter)
 Pipe 15" diameter, 242' long

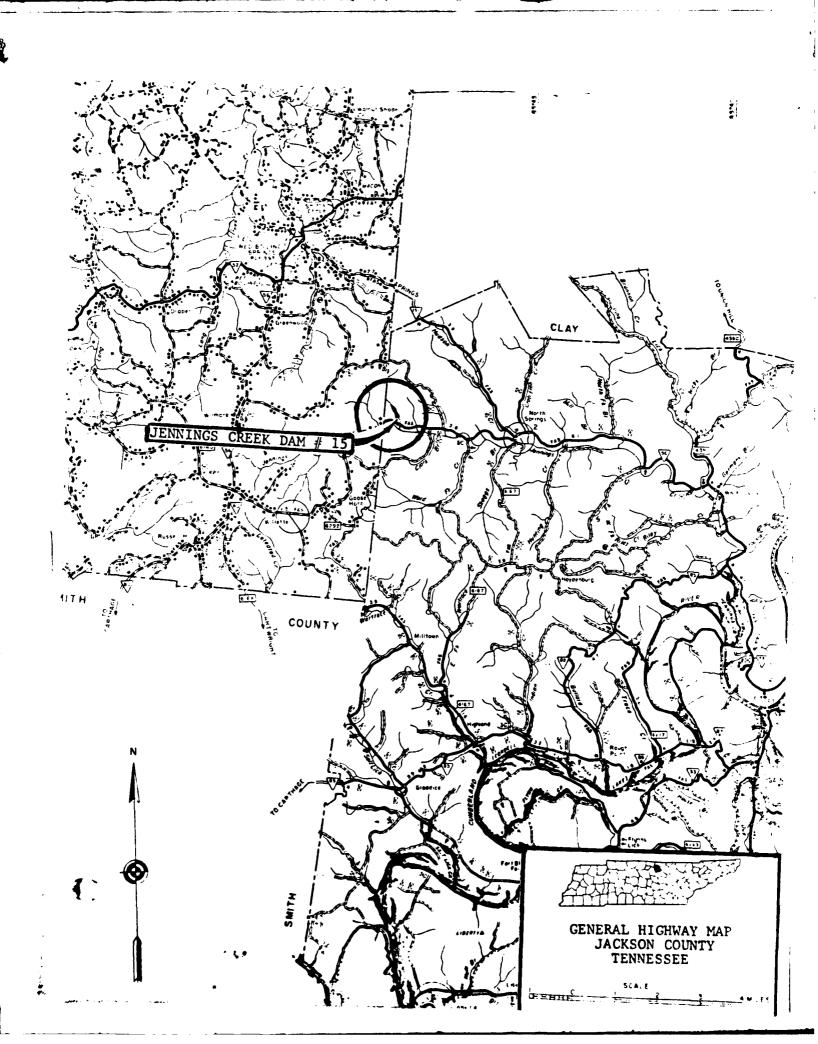

- c. Pipe gradient 1.5%
- d. Drawdown 16" opening covered by 24" slide gate

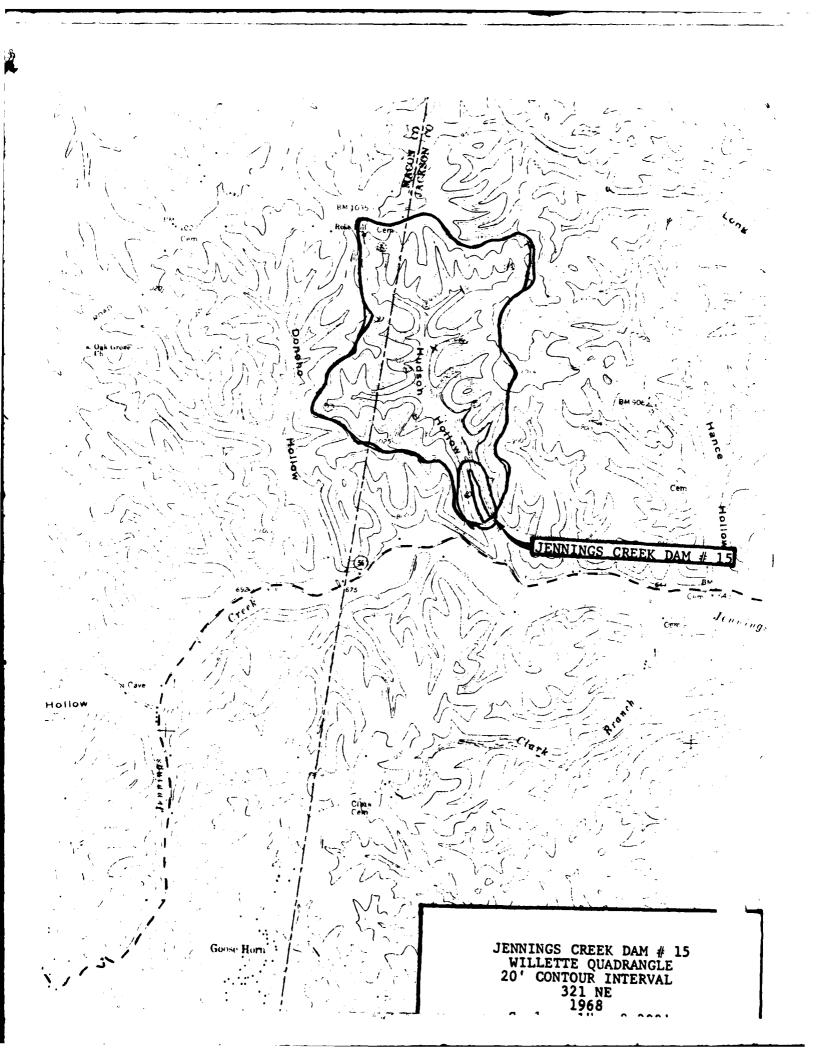

A.3.2 Emergency Spillway

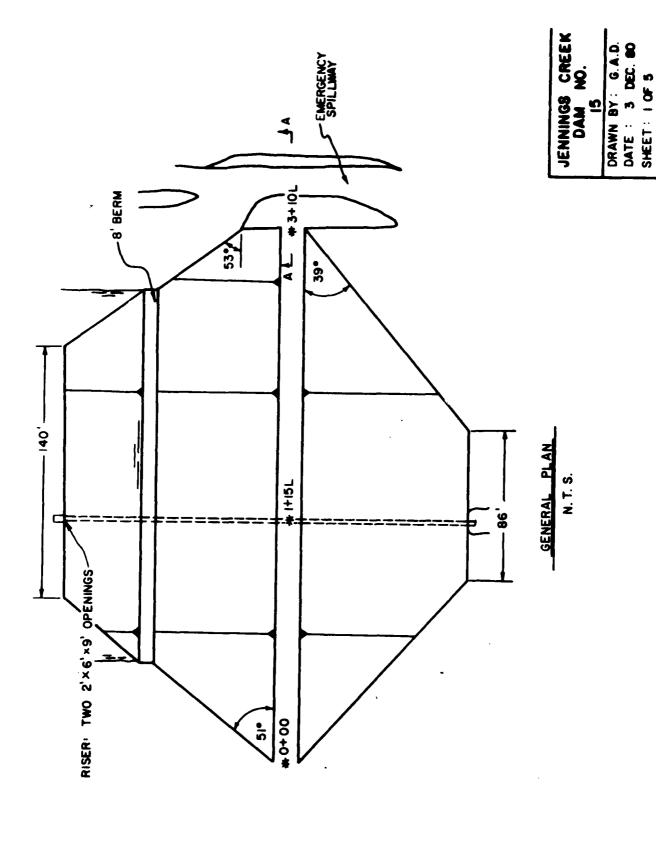

- a. Type Excavated in rock, right wall is fill material, left wall is natural bedrock.
- b. Size 16' bottom width, 2.4H:1V (rt) and 1.6H:1V (1t) side slopes, 4.7' above spillway crest, later slope becomes vertical.
- c. Capacity 1917 cfs at top of dam.
- A.4 Historical Data
- A.4.1 Construction Date 1961
- A.4.2 Designer Soil Conservation Service
- A.4.3 Builder Ascon, Inc.
- A.4.4 Owner Jonah Sadler (See A.1.6 Operation and Maintenance)
- A.4.5 Previous Inspections by SCS
- A.4.6 Seismic Zone 1
- A.5 Downstream Hazard Data
- A.5.1 Downstream Hazard Potential Classification High
- A.5.2 Persons in Likely Flood Path Approximately 8

- A.5.3 Downstream Property 2 houses several hundred feet downstream, State Route 56 crosses the channel approximately 1,000 feet downstream of the dam.
- A.5.4 Warning Systems None

| | | Jonah Saddler Route # 1, Red Boiling Springs, Tenn. 37150 Tel: 621-3361 | | | | |

 Lives in mobile home immediately downstream of dam.
 Drawdown valve is kept open always at his request due to fear of overtopping and because of problems with vagrants and vandals.

- 3) The emergency spillway has carried flow 3 times, once with the lake drained prior to the storm, twice with the lake at Normal Pool. Two of the floods occured June 1969, and 1974.
- 4) He was present during 1946 flood when several lives were
- 5) Under a 9" rainfall 4' depth was developed in the emergency spillway.
- 6) 16' deep artesian well just downstream of right abutment toe.

7) No foundation grouting was done.

According to Perry Fuqua (District Conservationist of Jackson County) the entire watershed board has retired or is deceased. Replacement procedures are difficult.

| IX. | Miscellaneous | | | | | | |
|-----------|---|--|--|--|--|--|--|
| | Incidents/Failures 3 times water has come over emergency | | | | | | |
| x. | spillway. | | | | | | |
| | Cbserved Geology of Area Rock outcropping of spillway is apparently Fort Payne formation. | | | | | | |
| | Conclusions The dam appears to be well constructed and in good | | | | | | |
| | condition. | | | | | | |
| n. | Recommendations | | | | | | |
| | 1) Keep the embankment clear of all woody vegetation. | | | | | | |
| | 2) Clear loose rock from left side of spillway base. | | | | | | |
| | 3) Reservoir should not be allowed to revert to a forested | | | | | | |
| | area. This could be achieved by maintaining the lake at | | | | | | |
| | Normal Pool elevation for one growing season. | | | | | | |
| | 4) The watershed district board should be reestablished and | | | | | | |
| | the inspection and maintenance schedule should be | | | | | | |
| | | | | | | | |
| | continued. | | | | | | |

APPENDIX F
HYDRAULIC AND HYDROLOGIC DATA

HYDROLOGIC AND HYDRAULIC ANALYSIS

According to OCE guidelines, Jennings Creek Watershed Dam No. 15 must be able to safely pass the Probable Maximum Flood (PMF) of 28.5" of rain falling in 6 hours. Six-hour rainfall depths for the Probable Maximum Precipitation (PMP) and the 100-year rainfall were obtained from the U. S. Weather Service's Technical Paper 40. Flood routings were performed using the HEC-1-DB computer program. The program used the dimensionless hydrograph technique described in Section 4 of the Soil Conservation Service National Engineering Handbook and the Modified Puls method of reservoir routing.

The peak outflow from the PMF is 7719 cfs which overtops the dam for 1.8 hours at a maximum depth of 2.8 feet. Program modification for an uneven crest and cleared spillway indicates that the dam will overtop 3.4 feet for the same duration.

SUMMARY OF ROUTINGS

| | ANTECEDENT MO | ISTURE CONDITION |
|------------|--|---|
| EVENT | 11 | 111 |
| PMF | Overtopped for 1.8 hrs. 2.8 feet maximum depth over dam | Overtopped for 2.2 hrs. 3.2 feet maximum depth over dam |
| ₹ PMF | Overtopped for 0.5 hrs. 0.81 feet maximum depth over dam | Overtopped for 0.5 hrs. 1.2 feet maximum depth over dam |
| LOO - YEAR | Passed. 13.7 feet of freeboard | Passes. 7.6 feet of freeboard. |

*Additional spillway capacity required to pass PMF 5802 cfs (AMC II) 7189 cfs (AMC III)

TENNESSEE DEPARTMENT OF CONSERVATION DIVISION OF WATER RESOURCES 4721 TROUSDALE DRIVE, NASHVILLE 37220 815/741-8880

Certified

December 1, 1980

Mr. Jonah Sadler Route 1 Red Boiling Springs, TN 37150

Dear Dam Owner:

As provided by the State Safe Dams Act, Tennessee Code Annotated, Sections 70-2501 to 70-2530, non-federal dams in Tennessee must be inspected and certified for safety by our agency. According to our records, you are identified as the owner of Jennings Ck Wtsd *15 Dam, located in Jackson County, Tennessee.

Enclosed for your information and review is a copy of our inventory record on the structure along with a copy of the Act and adopted rules and regulations.

Tentative plans are to schedule a safety inspection of your dam within the next few months. A staff engineer will very shortly be in further communication with you to discuss the pending inspection and your responsibilities under the Safe Dams Act. Your immediate attention, however, is called to the matter of maintaining the earthen dam with a good grass cover and clear of all brush, undergrowth and tree growth. If these conditions do not presently exist, please make plans to remove the brush, undergrowth and all trees less than two inches in diameter as soon as possible. Larger trees may have to be removed at a later date but must be done so under the direction of an experienced engineer.

Please let me, or our Chief Engineer, Mr. Ed O'Neill, know of any assistance we might be.

Very truly yours

Robert A. Hunt, P.E.

Director, Division of Water Resources

IN REPLY REFER TO

ORNED-G

NON-FEDERAL DAM INSPECTION REVIEW BOARD PO BOX 1070 NASHVILLE, TENNESSEE 37202

District Engineer, Nashville District US Army, Corps of Engineers PO Box 1070 Nashville, TN 37202

- The Interagency Review Board, appointed by the District Engineer on 8 October 1980, presents the following recommendations after meeting on 10 April 1981 to consider the Phase I investigation report on Jennings Creek Watershed Dam No. 15 inspected by the Tennessee Department of Conservation.
- 2. It is unclear as to the ownership of the dam and who is responsible for the operation and maintenance of the structure. This should be clarified and the owner be made aware of his responsibilities.
- 3. An emergency action plan should be developed, including a warning system to alert downstream residents, in the event a serious condition develops with the project.
- 4. An inspection during normal pool conditions should be undertaken to observe any problems not apparent with a dry reservoir.
- 5. The condition classification should be changed from "unsafe-nonemergency" to "significantly deficient."

6. The board is in agreement with report conclusions and recommendations following minor revisions
